Medical models made clear.

The Vivatheca platform is a non-profit, open-source library for exploring, explaining, sharing and printing medical models. Browser-based access keeps the first step simple; transparent review and known limitations keep trust visible.

Prototype notice: reviewer, licence, DOI and medical copy are not yet verified for production.

Drag to rotate · Scroll or pinch to zoom · Use arrow keys after focusing the model

One model. More ways to understand.

The Vivatheca platform connects the moment of explanation with everything that may come after it.

01
Explore it in 3D
Rotate, zoom and follow a captioned tour with keyboard and touch controls.

02
Explain it clearly
Switch between plain-language guidance and deeper clinical detail.

03
Take it further
Share the model, view it in AR, or prepare a version for physical printing.

AI-generated illustration.

From the screen to something you can hold.

Printable records can carry material, orientation, supports, build-volume guidance and estimated print time—so the model can move from explanation to hands-on learning.

Trust should be visible, not implied.

The planned review record makes clinical approval, reviewer privacy and the source of supporting health information visible without asking clinicians to give medical advice.

- ✓ **A review status visitors can read**
  Each model record is designed to show whether it is approved, rejected or awaiting clinical review, its model rating, and whether it has been recommended for review by clinicians.
- ✓ **Private verification, limited public attribution**
  A clinician's identity and eligibility to review are verified privately. The public record is limited to the reviewer's title, initials, occupation and country of practice.
- ✓ **A focused educational assessment**
  Reviewers are not asked to provide medical or health advice, or information about the procedure or condition. Their role is only to approve or reject whether the model reflects the named condition or procedure well enough for patient education.
- ✓ **Public information with a traceable source**
  Condition and procedure information is drawn from appropriately licensed public government health-service information, with source attribution and directions showing where to access further information.

Prototype governance: these safeguards describe the intended review workflow. No reviewer record or approval is presented as verified until the process is operating and complete.

Evidence for seeing and holding anatomy.

Independent, peer-reviewed research has tested how physical and virtual 3D models can support patient knowledge, communication and understanding. Findings depend on the clinical setting and should not be treated as universal proof.

These articles are independent evidence. Publication records connected to the Vivatheca platform will be added only after authorship and journal details are verified. The accompanying visuals are interpretive, not figures from the papers.

Impact of 3D-Printed Anatomical Models on Doctor-Patient Communication in Orthopedic Consultations

Cureus · 2024 · Randomized clinical trial

The trial compared consultations with and without 3D anatomical models and reported stronger patient knowledge and communication measures in the model group.

AI-generated illustration.

The use of 3-dimensionally printed models to optimize patient education and alleviate perioperative anxiety in Mohs surgery

Journal of the American Academy of Dermatology · 2019 · Randomized controlled trial

The study evaluated a printed procedural model alongside standardized education for patient understanding and perioperative anxiety.

AI-generated illustration.

Impact of a Virtual Three-Dimensional Thyroid Model on Patient Communication in Thyroid Surgery

Cancers · 2026 · Randomized controlled trial

Patients using a virtual 3D thyroid model showed improved comprehension of selected anatomy, surgical procedures and complications.

- Dentistry →
- Ear, Nose and Throat Surgery →
- Ophthalmology →
- Oral and Maxillofacial Surgery →
- Orthopaedics →

Five ways to move a model forward.

Contributions can strengthen the collection, extend physical access, verify anatomy and make explanations useful across languages.

Submit a model
Share browser-ready anatomy, documentation and source details for review.
Learn how →

Donate a printed model
Support printing and delivery for a clinic or hospital without local printing capability.
Learn how →

Donate 3D printing resources
Contribute filament, printing hardware or related equipment that can expand responsible model production and access.
Learn how →

Review clinical accuracy
Clinicians can assess anatomy, limitations and usefulness for patient education.
Learn how →

Translate health content
Health-area experts can adapt plain-language and clinical explanations for another language.

Sustainability for physical models.

The Vivatheca platform is exploring lower-waste pathways for physical models as printing grows. Current investigation includes recycling retired or failed prints and finding useful destinations for supports, prime towers, purge material and empty filament spools.

Prints	Retired, failed or superseded models
Process waste	Supports, prime towers and purge material
Consumables	Empty filament spools and packaging

Exploratory commitment: no verified recycling programme or recovery partner is currently presented.
